BRAIN METABOLISM IN PSYCHOSIS

- The brain absorbs the highest metabolic demand of any organ at rest (20 % of O₂ basal consumption and 50-65% of total metabolic requirement) with minimal reserve capacity (Kuzawa et al. PNAS 2014).
- SCZ patients show reduced glucose utilization (18F-FDG PET) in several cortical regions (meta-analytical evidence, with methodological caveats) (Hill et al. Acta Psych Scan 2004)
- Meta-analytical evidence of reduced cortical perfusion in SCZ from 150-H20 PET studies (Goozée et al. Neurosci. Biobehav. Rev. 2014)

- Meta-analytical evidence of increased lactate and decreased ph in post-mortem SCZ brains (controlled for post-mortem intervals and agonal state) (Hagihara et al. Neuropsychopharm. 2018)
- The same pattern has been observed *in vivo* using Magnetic Resonance Spectroscopy (MRS) (Dogan et al. Neuropsychopharm. 2018) and CSF biochemistry (Regenold Biol. Psych. 2009)
- Converging evidence from transcriptomics, proteomics, metabolomics indicates deficits in mitochondrial activity in SCZ (Prabakaran et a. Mol Psych. 2004; Rajasekaran et al. Neurosc. Biobehav. Rev. (2015)

The effect persists also after one week exposure to amisupride in healthy volunteers and it is linked with EPS

CONCLUSION

- O Brain metabolism is altered in psychosis
- Alterations in brain metabolism are present at the early stage of the disease, possibly reflecting abnormal neurodevelopment
- Antipsychotic treatment alters brain metabolism. What is the interaction with baseline anomalies? Are all AP equivalent?
- The investigation of brain metabolism in longitudinal cohorts might reveal pathophysiological mechanisms underlying altered brain function and behaviour, biomarkers for stratification and maybe new treatment targets.
